Time allowed: 45 Minutes

Q1. Write a Java class called *Employee*, which contains:

- Two **private** instance variables:
 - id (of the type int)
 - name (of the type String)
 - salary (of the type double)
- Two overloaded constructors
 - a default constructor with no argument
 - a constructor which takes id, name and salary as arguments.
- Two public methods
 - getAnnualSalary() – return the salary for a year
 - getIncrement() – returns the increment of salary
 - 2% increment per month.

Q2. Write another Java class *TestEmployee* which contains the **main** method.

1. Create an instance of *Employee* class *emp1* by invoking default constructor.
 - a) Set the value of id to 101, name to “Thor” and salary to 20000.00 for instance *emp1*.
 - b) Print the increment and annual salary of Thor.
2. Create an instance of *Employee* class *emp2* by passing id: 102, name: Loki, Salary: 15000.00
 - a) Print the increment and annual salary of *emp2*.

Q3. Compile and run your program to get the following output.

```
The increment details of Thor :400.0
The Annual salary of Thor :244800.0
The increment details of Loki :300.0
The Annual salary of Loki :183600.0
```
